

## Fork Positioner for Forklifts

Forklift Fork Positioners - A fork positioner is a tool made out of high quality materials meant to be able to withstand the most difficult procedures and work environments. This piece of equipment can enable the one driving to control the forks hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate much more exact lifting and placement in a quicker and much more efficient manner.

The unique fork pocket design can enable the person operating it to be able to safely sway the unit's forks without any worry of destroying the positioning cylinders. This allows the worker the option to either perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on existing units.
